

**CLASS 10<sup>TH</sup> MID TERM**

**SCORE  
BOOSTER**

**HUMAN EYE & THE  
COLOURFUL WORLD**

**ONE SHOT**

**PHYSICS**

## Human Eye

- Eye Defects
  - Myopia
  - Hypermetropia
  - Presbyopia

## Dispersion of Light

- Splitting of white light into its constituent colours
- Rainbows are formed due to natural dispersion of light

## Scattering of Light

- Redness of the Sun during sunrise and sunset
- Blueness of sky
- Red light scatters the less

## Atmospheric Refraction

- Twinkling of stars
- Planets do not twinkle
- Advanced sunrise and delayed sunset

# Your Roadmap to Success

---

Stay on track with a structured schedule that covers every essential topic you need for mid-term success. Each class is designed to reinforce core concepts and provide ample practice to ensure you're fully prepared. Follow the timetable, access class PDFs, and watch video lessons—all at your own pace. Your journey to acing the exams starts here!

## Human Eye

**MCQ 1:** A student sitting on the last bench can read the letters written on the blackboard but is not able to read the letters written in his text-book. Which of the following statements is correct?

- (a) The near point of his eyes has receded away
- (b) The near point of his eyes has come closer to him
- (c) The far point of his eyes has come closer to him
- (d) The far point of his eyes has receded away

# Human Eye

**SA 1:** Study the diagram given below and answer the questions that follow :

- i. Name the defect of vision depicted in this diagram stating the part of the eye responsible for this condition.

**Answers:**

- i. Hypermetropia. The eye lens is responsible for this condition.

## Human Eye

**SA 1:** Study the diagram given below and answer the questions that follow :

ii. List two causes of this defect.

Answer:

- (i) The focal length of the eye lens is too long,
- (ii) The eyeball has become too small

## Human Eye

**SA 1:** Study the diagram given below and answer the questions that follow :

- iii. Name the type of lens used to correct this defect and state its role in this case.

Convex lens,

It helps to focus the rays into the retina.

## Human Eye

**SA 2: Define the term power of accommodation of human eye. Write the name of the part of eye which plays a major role in the process of accommodation and explain what happens when human eye focuses (i) nearby objects and (ii) distant objects.**

**Answers:**

The ability of the eye lens to adjust its focal length is called accommodation. However, the focal length of the eye lens cannot be decreased below a certain minimum limit.

The ciliary muscles play the major role in the process of accommodation by adjusting the curvature of the eye lens.

# Human Eye

**SA 2: Explain what happens when human eye focuses (i) nearby objects and (ii) distant objects.**

## Answers:

- (i) When you are looking at objects closer to the eye, the ciliary muscles contract. This increases the curvature of the eye lens. The eye lens then becomes thicker. Consequently, the focal length of the eye lens decreases. This enables us to see nearby objects clearly
- (ii) When the muscles are relaxed, the lens becomes thin. Thus, its focal length increases. This enables us to see distant objects clearly

## Human Eye

**SA 3: Name the type of lens presented by opticians for the correction of hypermetropia. State the role of such lenses in correcting the vision of the person suffering from this defect.**

**Answers:**

Opticians prescribe convex lenses (also called **converging lenses**) for the correction of hypermetropia, commonly known as farsightedness.

Convex lenses help correct the eye's focusing issue by making near objects appear sharp.

## Homework Answers

Mcq 1: Absolute refractive index of glass and water is  $\frac{3}{2}$   ~~$\frac{2}{3}$~~  and  $\frac{4}{3}$   ~~$\frac{3}{4}$~~  respectively. If the speed of light in glass is  $2 \times 10^8$  m/s, the speed of light in water is :

- (A)  $\frac{9}{4} \times 10^8$  m/s
- (B)  $\frac{5}{2} \times 10^8$  m/s
- (C)  $\frac{7}{3} \times 10^8$  m/s
- (D)  $\frac{16}{9} \times 10^8$  m/s

$$\frac{n_g}{n_w} = \frac{c/v_g}{c/v_w}$$
$$= \frac{v_w}{v_g}$$

$$v_w = v_g \times \frac{n_g}{n_w}$$
$$= 2 \times 10^8 \times \frac{9}{4} = \frac{9}{4} \times 10^8 \text{ m/s}$$

$$n_g = \frac{3}{2} = \frac{c}{v_g}$$

$$n_w = \frac{4}{3} = \frac{c}{v_w} \rightarrow$$

$$\frac{n_g}{n_w} = \frac{3/2}{4/3} = \frac{3}{2} \times \frac{3}{4} = \frac{9}{8}$$

## Homework Answers

MCQ 2: How will the image formed by a convex lens be affected, if the upper half of the lens is wrapped with a black paper ?

(A) The size of the image formed will be one-half of the size of the image due to complete lens.

(B) The image of upper half of the object will not be formed.

(C) The brightness of the image will reduce.

(D) The lower half of the inverted image will not be formed.

## Homework Answers

**SA 1:** Sudha finds out that the sharp image of the window pane of her science laboratory is formed at a distance of 15 cm from the lens. She now tries to focus the building visible to her outside the window instead of the window pane without disturbing the lens. In which direction will she move the screen to obtain a sharp image of the building? What is the approximate focal length of this lens?

## Homework Answers

**SA 2:** How are power and focal length of a lens related? You are provided with two lenses of focal length 20 cm and 40 cm respectively. Which lens will you use to obtain more convergent light?

$$P = \frac{1}{f} \quad f \rightarrow m.$$

$$P_1 = \frac{100}{20} = \underline{\underline{+5 D}} \leftarrow$$

$$P_2 = \frac{100}{40} = 2.5 D$$

## Homework

**LA 1:** The image of a candle flame formed by a lens is obtained on a screen placed on the other side of the lens. If the image is three times the size of the flame and the distance between lens and image is 80 cm, at what distance should the candle be placed from the lens? What is the nature of the image at a distance of 80 cm and the lens?

- 1) Real
- 2) Inverted
- 3) Magnified

$$m = \frac{v}{u} = 3$$

$$\Rightarrow \frac{80}{u} = 3$$

$$u = \frac{80 \cdot 3}{3}$$

$$u = \underline{27 \text{ cm}}$$

## Homework Answers

**LA 2:** A student focussed the image of a candle flame on a white screen using a convex lens. He noted down the position of the candle screen and the lens as under  
Position of candle = 12.0 cm  
Position of convex lens = 50.0 cm  
Position of the screen = 88.0 cm

(i) What is the focal length of the convex lens?

$$\begin{aligned} u &= (50 - 12) = 38 \text{ cm} \\ v &= (88 - 50) = 38 \text{ cm} \end{aligned} \quad \left\{ \begin{array}{l} 2f = 38 \\ f = 19 \text{ cm} \end{array} \right.$$

(ii) Where will the image be formed if he shifts the candle towards the lens at a position of 31.0 cm?

$$u = (50 - 31) = \underline{19 \text{ cm}}, \text{ Infinity.}$$

## Homework Answers

### LA 2:

- iii. What will be the nature of the image formed if he further shifts the candle towards the lens?

$u < f$ , Virtual, Erect & magnified.

- iv. Draw a ray diagram to show the formation of the image in case (iii) as said above.

# ? Dispersion of White Light

**MCQ 2 :** A prism ABC (with BC as base) is placed in different orientations. A narrow beam of white light is incident on the prism as shown in Figure below. In which of the following cases, after dispersion, the third colour from the top corresponds to the colour of the sky?

- a) (i)
- c) (iii)
- ✓ b) (ii)
- d) (iv)

## Dispersion of White Light

**MCQ 3 :** Which of the following phenomena of light are involved in the formation of a rainbow?

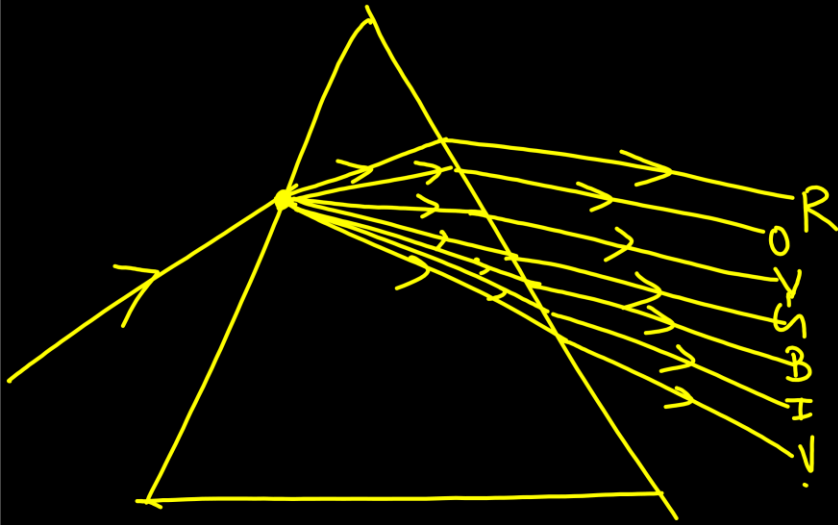

- (a) Reflection, refraction and dispersion
- (b) Refraction, dispersion and total internal reflection
- (c) Refraction, dispersion and internal reflection
- (d) Dispersion, scattering and total internal reflection

## Dispersion of White Light

**SA 3 :** What is dispersion of white light ? State its cause. Draw a diagram to show dispersion of a beam of white light by a glass prism.

### Answers:

The splitting of white light into its seven component colours is called dispersion.

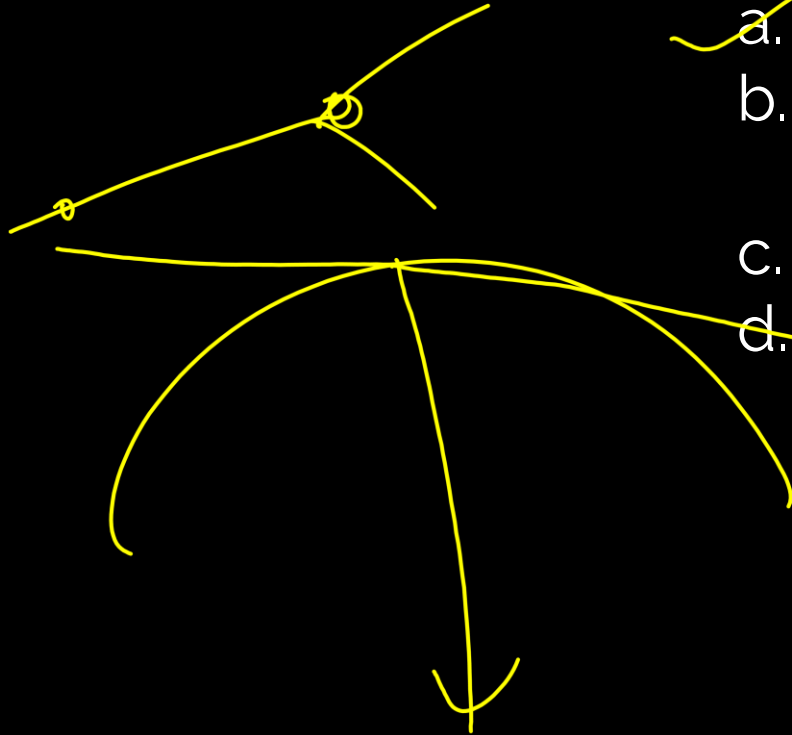

Different colours of light bend through different angles with respect to the incident ray, as they pass through a prism. This causes dispersion of light

## Scattering of Light

**MCQ 4:** At noon the sun appears white as

- a. light is least scattered
- b. all the colours of the white light are scattered away
- c. blue colour is scattered the most
- d. red colour is scattered the most

## Scattering of Light

**MCQ 5:** The clear sky appears blue because

- (a) blue light gets absorbed in the atmosphere
- (b) ultraviolet radiations are absorbed in the atmosphere
- (c) violet and blue lights get scattered more than lights of all other colours by the atmosphere
- (d) light of all other colours is scattered more than the violet and blue colour lights by the atmosphere

## Scattering of Light

**MCQ 6:** The danger signals installed at the top of tall buildings are red in colour. These can be easily seen from a distance because among all other colours, the red light

- (a) is scattered the most by smoke or fog
- ✓ (b) is scattered the least by smoke or fog
- (c) is absorbed the most by smoke or fog
- (d) moves fastest in air

## Atmospheric Refraction

**LA 1:** Why do stars twinkle but not the planets?

**Answers:**

The twinkling of a star is due to atmospheric refraction of starlight. The starlight, on entering the earth's atmosphere, undergoes refraction continuously before it reaches the earth. The apparent position of the star is slightly different from its actual position. Further, this apparent position of the star is not stationary, but keeps on changing slightly.

The planets are much closer to the earth and are thus seen as extended sources. Thus, they do not twinkle.

## Homework

MCQ 1: Which of the following phenomena contributes significantly to the reddish appearance of the sun at sunrise or sunset?

- (a) Dispersion of light**
- (b) Scattering of light**
- (c) Total internal reflection of light**
- (d) Reflection of light from the earth**

## Homework

MCQ 2: The bluish colour of water in deep sea is due to

- (a) the presence of algae and other plants found in water
- (b) reflection of sky in water
- (c) scattering of light
- (d) absorption of light by the sea

## Homework

**SA 1:** Draw ray diagrams each showing (i) myopic eye and (ii) hypermetropic eye.

**SA 2:** A person needs a lens of power  $-4.5$  D for correction of her vision.

- (a) What kind of defect in vision is she suffering from?
- (b) What is the focal length of the corrective lens?
- (c) What is the nature of the corrective lens?

## Homework

**LA 1:** A student sitting at the back of the classroom cannot read clearly the letters written on the blackboard. What advice will a doctor give to her? Draw ray diagram for the correction of this defect.
